Did some more updates pertaining to the overhaul of the PIC USB core code. I have added compiled documentation for the basic USB interface class , and for the bootloader interface class , both of which are now compiled to their own respective DLL files for ease of use. Their respective articles are semi-updated. The USB interface class code is up, which includes the compiled DLL as well. The bootloader article is a mess, quite a bit of it is outdated now so it's crossed out, and I haven't written enough about the new code to replace it yet. But, the code for the new bootloader interface DLL is now in there, as well as the updated bootloader application. Bear with me.

I still hope to refactor the 'asynchronous' example code sometime, but so far these other two have been enough work to keep me busy.

Because everything is in limbo, I would greatly appreciate it if you would email me if you happen to try out some of the code and encounter any issues with it, I'd much rather find out about them sooner rather than after they've been posted for months!
